

## Static Conductive Belts

Under certain conditions of temperature and humidity, a belt drive may generate static electricity. Belts intended for operation in a potentially dangerous atmosphere should be constructed with a relatively low electrical resistance characteristic. It has become common practice to specify and refer to such belts as “static conductive,” “static dissipating,” or “anti-static.”

The accumulation of electro-static charges can be dangerous for different reasons:

- Generation of radio interference that can cause disturbance to electrical apparatus
- Risk of ignition and explosion in an atmosphere with high levels of combustible materials
- Risk of injury to workers in contact with the components

### V-Belt Drives

Carlisle belts identified with a check mark on the chart to the right are static conductive based on testing developed by the Association for Rubber Products Manufacturers (ARPM) Bulletin IP3-3. These belts are clearly branded as “static dissipating.”

### Synchronous Belt Drives

Carlisle synchronous belts are not static dissipating.
